Chemical nature of high molecular weight hydrocarbons of petroleum. S. R. Sergienko and A. A. Mikhnevskaya. Doklady Akad. Nauk S.S.R. 91, 103-6 (1953). Examin. Devonian deposits was made by chromatographic adsorption on silica gel with pet. ether, benzene, and benzene-EtOH solvents. The material, b. 200-370°, contained 40% of paraffin and naphthalene hydrocarbons, 13.8% monocyclic aromatic hydrocarbons, 17.1% bicyclic and 17.4% polycyclic aromatic hydrocarbons, and 2.6% tars and losses. The kerosine cuts contain 75% of paraffin and naphthalene hydrocarbons and 11% monocyclic and 10.5% bicyclic aromatic hydrocarbons. The light oil contained 40% of paraffin and naphthalene hydrocarbons, 19% monocyclic, and 27.7% bicyclic aromatic hydrocarbons. G. M. Kosolapoff

The conversions of butyl chloride with oxide catalysts.
S. R. Sergiyenko and E. V. Nozdrina. *Trudy Inst. Nefte Akad. Nauk S.S.R.* 4, 66-80 (1954); cf. *C.A.* 47, 12208g.
— Me_3CCl (I) is totally converted into dimer and trimer of isobutylene over CaO during 20 hrs. at 100° and 51 atm. N pressure. Under the same conditions with a mixt. of I with isobutylene, I is converted into isobutylene only; with isopropyl chloride, I is hydrolyzed, forming Me_2COH . Increasing the pressure provokes an increase of dimer formation, while the amt. of Me_2COH decreases. I with CaO or ZnO is converted into dimer and trimer; isobutyl chloride formed the same products over ZnO only. The velocity of conversions of I with ZnO at 100° is almost twice that of isobutyl chloride. M. Charmandarian

SERGIYENKO, S.R.

The conversion of 2-hexene and isopropyl chloride on the complex catalyst. A. A. Mikhnovskaya, S. R. Sergienko and V. A. Shakhral. *Trudy Inst. Nefte Akad. Nauk S.S.R.* 4, 81-92 (1954). — To 4 g. of ice-cooled anhyd. AlCl_3 in a round-bottom flask, with reflux condenser, is added dropwise while stirring 2.67 g. of a mixt. of 35% nitroethane, 10% 1-nitropropane, and 65% 2-nitropropane. After stirring 1 hr., the mixt. forms a viscous liquid (I). The mixt. of isopropyl chloride and 2-hexene (mol. ratio 1:1) at 0° and normal pressure form in the presence of I 16-17% hexyl chlorides, and 32-38% dimers and alkyl-polymer of hexene during 3-4 hrs. The major part of the hexyl chlorides, b. 123.4°, is 2-chlorohexane. At 0° and

normal pressure alkylation of hexene with isopropyl chloride does not take place. Under the same conditions isoprene in the mixt. with isopropyl chloride spontaneously polymerizes. M. Charmandarjan

SERGIYENKO, S.R.

~~CH~~ ✓ The mechanism of conversion of isopropyl chloride on zinc oxide. S. R. Sergienko, A. Miklinovskaya, and E. V. Nizdrina. Trudy Inst. Nefte Akad. Nauk S.S.R. 4, 93-100(1954). Isopropyl chloride (I) is almost completely converted into propylene in the presence of ZnO, at 250-327° and atm. pressure. Under 40 atm., the polymerization of I occurs and the 5-7% dimer 34% trimer and 20% high polymer are formed. Under the same conditions (1 atm.), 2,3-dimethyl-1-butene or 2-butene did not polymerize but reacted with isopropyl chloride. At the higher pressure, 2,3-dimethyl-2-butene partly (6%) isomerized to 2,3-dimethyl-1-butene. It was concluded that intermediate formation of dimethylbutene from isopropyl chloride did not take place. It is found that a method of analysis, based on the adsorption of butylenes and propylene by H₂SO₄ of concn. 68 and 85%, resp., is not accurate for gas rich in propylene, because it is highly adsorbed by 68% H₂SO₄.

Title : Investigation of high-molecular petroleum compounds. Part 1.- Use of color photography for the characteristics of the luminescence chart

Periodical : Izv. AN SSSR. Otd. khim. nauk 4, 716 - 721, July - August 1954

Abstract : The advantages derived by fixing the luminescence chart for various components of high-molecular tarry-petroleum compounds, with the aid of color photography, are listed. Lead glass was found to be the most satisfactory and convenient filter capable of intercepting ultraviolet rays and thus eliminating their effect on the photo-film. A luminescence analysis completed with color photography becomes an objective method for qualitative evaluation of chemical changes in the components of high-molecular tarry-petroleum substances. h) Liquid-phase oxidation of *n*-undecene, *n*-heptylbenzene, *n*-heptylcyclohexane, and 1-methyldecahydronaphthalene by air oxygen. S. R. Sergienko and P. N. Galich. *Kataliticheskoe Gidrirovaniye i Oksidlenie*, Akad. Nauk Kazakh. S.S.R., Trudy Konf. 1955, 255-64. -- In liquid phase air oxidation of hydrocarbons at 15° for 10-100 hrs., the 1st stage is the formation of peroxides which reaches a max. in 10 hrs. and declines to nearly 0 by 100 hrs. The kinetic curves of time vs. acid no., bromine no., sapon. no., peroxide content and O content are shown for *n*-undecene, *n*-heptylbenzene, *n*-heptylcyclohexane, and 1-methyldecahydronaphthalene. The tendency to form tars during oxidation declines in order: undecene, 1-methyldecahydronaphthalene, heptylcyclohexane, heptylbenzene. Tar formation

begins to be noticeable after some 50 hrs. The gradual decline of the rate of oxidation and its practical cessation in the presence of as yet unreacted materials is ascribed to the neg. catalytic activity of the tars which act as antioxidants.

✓ Dehydrogenation of ethylbenzene on zinc chromate. S.
R. Sergienko and L. S. Povarov. *Trety Inst. Nefte Akad.*
Nauk S.S.R. R. 6, 40-52 (1955). — ZnCrO₄ on ZnO can be
used to dehydrogenate EtPh. Dehydrogenation at low
space velocity leads to greatly increased secondary reaction
of styrene, the rate of which increases faster with rising
temp., than dehydrogenation resulting in much coke (about
10% in 3 hrs.) deposition on the catalyst. However, the
catalyst retains activity for more than 20 hrs. above 600°
and can be reactivated by a stream of air at 500° for 2-3
hrs. The catalyst withstands heating to 700° without loss
of activity. Energy of activation for catalytic dehydro-
genation of EtPh was calcd. as 20,530 cal./mole; energy of
activation for pyrolysis of EtPh as 48,100 cal./mole.

Transformations of diene hydrocarbons with a conjugated system of double bonds on alumina-silicate and alumina-chromate catalysts. I. Transformation of 2,3-dimethyl-1,3-butadiene. S. R. Sergienko and N. B. Zhdanova.

Z
Trudy Inst. Nefte Akad. Nauk S.S.R., 6, 63-70 (1955).

Expts. were conducted at 200-250° with alumina-silicate and at 250-300° with alumina-chromate catalysts. Reaction proceeds essentially in same direction on both catalysts; action of alumina-silicate catalyst is more aggressive and destructive. Primary reactions proceed in the following directions: (a) dimerization with the formation of cyclic compds. having a 6-membered ring as a basis and subsequent redistribution of H, accompanied by the dehydrogenation of one portion of the hexamethylene rings to benzene rings and hydrogenation of another portion of unsatd. 6-membered rings to satd. hexamethylene rings; (b) hydrogenation of the original diene system into a monolefinic or completely satd. system; and (c) dehydropolymerization with the formation of a solid, polycyclic(penta-hexamer) hydrocarbon which is deposited on the catalyst. All the above transformations are conjugated among themselves, since the H which is liberated in the reactions serves as a source of satn. of the unsatd. hydrocarbons. The basic reactions are complicated by secondary reactions which should include, above all, dealkylation. After 2-3 hrs., there is a sharp loss in activity of catalysts due to deposition of condensation products of original diene. The product on alumina-silicate catalyst had a mol. wt. of 442 and corresponded to a penta-hexamer of the original diene. Formation of catalyst poisons can be considerably retarded or completely suppressed by reducing contact time, feeding H or inert gas into reaction zone, or conducting the reaction in vacuum. A diagram of the general course of primary reactions is given.

Title : Relation between the tendency of vitrification at low temperatures and the structure of molecules of certain morpholine derivatives

Periodical : Dok. AN SSSR 102/1, 101-104, May 1, 1955

Abstract : Experiments were conducted to determine the freezing point of morpholine derivatives and to establish its relation to the molecular structure of the compound. The effect of individual structural elements on the properties of the molecules is explained. It is evident that all compounds capable of conversion into vitreous (freezing) state have general structural elements like the $\text{NCH}_2\text{CH}_2\text{OR}$ group where R is the hydrocarbon radical. The presence or absence of a double bond in the hydrocarbon radical was found to be of no importance just as unimportant as the structure of nitrogen bound radicals. Title : Hydrocarbon Constitution of Bitkovo and Radchen-
kovo Petroleum

Orig Pub: Tr. In-ta nefti AN SSSR, 1956, Vol 8, 191-198

Abstract: Bitkovo and Radchenkovo oils belong to the low-sulfur mixed-base oils with a predomination of naphthenic-paraffinic hydrocarbons in the fractions boiling below 350°. Kadchenkovo crude is light, low in resins, and paraffinic; Bitkovo crude is heavy, high in resins, and paraffinic. The solid hydrocarbons in Bitkovo crude have been observed to crystallize easily and to be easily separable

Card 1/2

Abstract: from the oil. The cause of this phenomenon appears to be the absence of noticeable amounts of branched paraffinic hydrocarbons and the high content of asphaltic material. The application of carbamide extraction and double rectification to the Bitkovo crude fraction boiling between 150 and 200° has given quantitative yields of C₉H₂₀, C₁₀H₂₂, C₁₁H₂₄ [TU]: presumably paraffins,

APPROVED FOR RELEASE 08/23/2000 CIA-RDP86-00513R001548120011-8"

C_nH_{2n+2}. It is shown that the use of dichloroethane is preferable to that of petroleum ether or isooctane in the carbamide separation of the paraffin hydrocarbons. Microphotographs of the paraffine hydrocarbons separated from the various crude fractions investigated are presented.

3604. TAR FORMATION DURING OXIDATION OF HYDROCARBONS. II. EFFECT OF
[HYDROCARBON] GROUP COMPOSITION OF DIESEL FUELS ON THE DIRECTION OF OXIDATION

Sergienko, S.R. and Galich, P.N. (Zh. prikl. Khim. (J. appl. Chem., Moscow), 1956, vol. 29, 1568-1580; abstr. in Chem. Abstr., 1957, vol. 51, 6986). Tar was removed from a 200-365° fraction of diesel fuel (BZ) by chromatography on silica gel and was separated, respectively, into fractions of aromatic hydrocarbons (I), 20.7% and paraffins-cycloparaffins. The latter fraction was treated with urea and separated into n-paraffins (II), 12.4%, and isoparaffins-cycloparaffins (III), 62.1%, leaving a residue (IV), 4.8%. Each fraction was oxidized by air at 150° in 2 parallel furnaces. The properties of the products were plotted as functions of the oxidation time. The properties of I did not change appreciably; a slight darkening indicated a slow condensation. Those of IV changed a little more. The plots of II and III gave similar functions. The proportion of peroxides rose abruptly to a maximum within 2 hours for III and 9 hours for II. Beyond this maximum the acid number, the saponification number, and the proportion of oxygen-containing substances increased continuously. Tar formation became noticeable in 50 hours with III and in 75 hours with II. Oxidation of diesel fuel is retarded not so much by I as by the products of cleavage of the peroxides formed.

✓ Tar formation in the oxidation of hydrocarbons. III.
Effect of aromatic hydrocarbons on the course of the oxidation
of hydrocarbon mixtures. S. R. Sergienko, P. N.
Galich, and V. I. Leylev. Zhur. Priklad. Khim. 29, 1710-20
(1950); cf. C.A.I. 50, 1336e. — In air oxidation of the hydro-
carbons from the isobutane-cycloparaffin fraction of Diesel
fuel, the initial stage involves the formation of peroxides

which reaches a max. in about 2 hrs. after which the per-
oxide content decreases steadily. Peroxide formation pre-
cedes the formation of acidic, hydrolyzable, and OH com-
pds. Addn. of 10% or less of diisopropylbenzene to the
charge does not affect the oxidation kinetics, but 25% or
more almost completely stops oxidation. The retarding
effect is not produced by diisopropylbenzene itself, but by the
products of decomprn. of its peroxides. Max. retardation is
caused by addn. of 20-5% aromatic compds. G. M. K.

"Causes of deposit formation in Diesel oil during storage.
S. R. Sergienko and P. N. Galich, *Zhur. Priklad. Khim.*
30, 1853-80 (1957).—Aromatic hydrocarbons and cyclo-
and isoparaffin fractions obtained from Diesel oil by chro-
matographic methods (cf. C.A. 50, 8186) as well as Diesel oil
were kept 2-6 years in open glass vessels at room temp.
The aromatic hydrocarbons were most susceptible to de-
posit formation; after 2 years 0.2% of asphaltenes had
formed. The cyclo- and isoparaffins showed an extended
induction period so that after 2 years deposits were absent
but a high concn. of peroxides was found. Deposit forma-
tion was at first rapid, reached a max., and decreased subse-
quently, apparently retarded by oxidation products.

Reviewed 7/1957

ABSTRACT The oxidation of the liquid hydrocarbons was carried out by means of oxygen being blown through them. The absorbed quantity of oxygen was ascertained from the pressure decrease in the closed circulation plant and the measured quantities were periodically replenished. The residual quantity of the initial product as well as the quantities of superoxides, acids, ethers and alcohols were then determined. Di-benzyloxydation was carried out at 110, 130, 140, and 150°. The S-shape of the curve (ill. 1) and the fact that the semi-logarithmic ana-morphism of its initial parts are straight lines, give evidence of a reaction process according to a chain mechanism with degenerated branches. In the initial phase practically only superoxides (monohydre-) develop. Other oxydation products are produced by the decay of the hydrosuperoxide with later oxydation of the products developed. After a retardation of the oxygen absorption its consumption proceeds with a steady, very small velocity. The dibenzyl replenishment on the initial quantity in this phase did not accelerate the oxygen absorption. It follows from this that the oxidation delay does not origi-

 PURPOSE: This book is intended for the specialist working in the
 field of petroleum chemistry and for the organic chemist working in
 related fields.

CONTENTS: This is the first volume of the series devoted to the pro-
 cesses made in petroleum and gas chemistry. The first part of this
 collection contains survey articles compiled by the staff of the
 Petroleum Institute, AS USSR. The authors are specialists working
 on methods for the isolation, separation, and identification of
 sulfur organic compounds in petroleum. The articles give a survey
 card 1/6

of literature up to 1956 with some coverage of recent research up
 to 1958. The second part is concerned with the characteristics of
 high molecular weight compounds and methods for the study of their
 composition. There are 123 references.

TABLE OF CONTENTS:

PART II. HIGH MOLECULAR WEIGHT COMPOUNDS OF PETROLEUM

Serpyentov, S.M., High Molecular Weight Compounds of Petroleum 199
 This paper covers the study of the composition of high-
 molecular weight petroleum fractions. It includes such of the
 author's own research. Several of the points are debatable
 and the conclusion of organic compounds into one large
 group of hydrocarbons is regarded by the editor as improper.
 The problem has not yet been solved, namely, the
 relationship between monomers and polymers in crudes
 is also treated. It is assumed that there are two basic
 types of polymers in crude: the primary and the secondary
 polymers. N.B. Zelinskii and K.P. L'vovskiy indicated

polymers, but they were not mentioned in the present

PERIODICAL: Vestsiya Akademii Nauk SSSR, Otdeleniye Khimicheskikh Nauk,
1958, Nr 4, pp. 437 - 445 (USSR)

ABSTRACT: During the last years in a number of works it was pointed
out that saturated hydrocarbons are subject to a remarkable
isomerization (References 1-4) under hydrogen pressure
in the presence of catalysts (alumosilicates). This hetero-
genous isomerization reaction of saturated hydrocarbons
found already industrial use at largest extent. Though there
is great attention paid to the preparation of catalysts
there are, however, relatively few works dealing with the
investigation of the reaction of individual hydrocarbons

Card 1/3

62-53-4-6/32

Isomerization of Saturated Hydrocarbons. Communication 1: Isomeric Conversions of Alkanes With C₆ - C₈ Structure

(on the same conditions). Only the works by Chialetta and Khanter (Reference 4) are an exception here. As the investigation of isomeric conversions of the individual hydrocarbons of different structure is of greatest interest the authors decided to carry out a systematic investigation of the isomerization reaction of the alkanes with a C₆-C₈ structure. The experiment was carried out according to the flowing system on special conditions and all experiments of the isomerization of the individual hydrocarbons were performed at 10 atmospheres excess pressure. The obtained experimental data were compared with the calculated thermodynamic values. A new mechanism of isomeric conversions of saturated hydrocarbons in the presence of polyfunctional catalysts was suggested. According to this mechanism the first stage of reaction leads to the formation of olefines. Also a great

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Khimicheskikh Nauk,
1958, Nr 5, pp. 575-583 (USSR)

ABSTRACT: The use of polyfunctional catalysts makes the successful inve-
stigation of the isomerization of saturated hydrocarbons with a
boiling-point up to 150°C possible. Nevertheless, it is very
difficult to achieve the isomerization of paraffins (with a
boiling-point above 200°C) in the presence of heterogeneous
catalysts. The purpose of this work was the investigation of
the structure and of the properties of the isomerizes. Above
all, the isomerization of a series of alkanes (structure C₁₂-
-C₁₆) was investigated in the presence of polyfunctional cata-
lysts. It was found that ramified hydrocarbons, mainly with 2
methyl-secondary-groups are formed due to the isomerization of

Card 1/2

2. Isomeric Conversions of the Alkanes of the C₁₂ - C₁₆-Structure 62-58-5-8/27

the alkanes. Moreover, a catalyst with lower fission-properties was found in the isomerization of high-boiling hydrocarbons. A thermodynamic calculation of the real equilibrium-compositions of the alkanes of the C₁₂ - C₁₆ was carried out. There are 5 tables and 12 references, 8 of which are Soviet.

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye khimicheskikh nauk,
1958, Nr 6, pp. 730 - 738 (USSR)

ABSTRACT: In various earlier papers the isomeric transformations of
alkanes are discussed, which develop in the presence of poly-
functional catalysts under hydrogen pressure (Refs 1,2). The
main purpose of this paper is the investigation of the rules
governing the isomerization of hydrocarbons and of the connection
between structure on the one hand and kinetic and thermodynamic
parameters on the other. The catalytic isomerization of the
cycloparaffin hydrocarbons C₆ - C₉ in the presence of a poly-
functional catalyst under hydrogen pressure was carried out.
Furthermore, it was found that the isomerization products of
the cycloparaffins C₇ and C₈ correspond with respect to their
composition to the thermodynamic values obtained by calculation.

Card 1/2

The Isomerization of Saturated Hydrocarbons.

SOV/62-58-6-13/37

Communication 3. The Isomeric Transformation of Cyclanes

A mechanism for the isomerization of cycloparaffins was suggested, according to which the formation of unsaturated hydrocarbons figures as the first stage of reaction. Furthermore the influence exercised by pressure and temperature upon the direction of the reactions of cycloparaffins in the presence of a polyfunctional catalyst was shown. There are 5 tables and 17 references, 8 of which are Soviet.

TITLE:

The synthesis of high-boiling cyclic hydrocarbons and their
structure / Изучение высококипящих углеводородов циклического строения /

PERIODICAL:

Seklad, Khimicheskaya promst., 1950, Vol. 34, No. 1, pp. 543-547
(USSR)

ABSTRACT:

Systematic investigations of the synthesis of individual hydrocarbons and of their properties and reactions are the basis of recently developed new and powerful methods of analysis of mixtures of water and hydrocarbons. Spectral methods, employing various kinds of radiation range are sufficiently among them. At present the examination of the composition, the structure, and the properties of the fraction of mineral oil with the highest molecular weight is of actual interest, this fraction representing more than half the amount of crude oil. In this case a physical and chemical analysis can be employed, that is to say, methods for the determination of the quantitative dependences of the basic physical properties

Card 1/3

SOV/2c-12c-3-29/67

The Synthesis of High-Molecular Hydrocarbons of Mixed Structure

of the entire complicated system upon its chemical composition. For this purpose it is necessary to investigate the said dependence simultaneously with natural complicated systems as well as with artificial mixtures of individual compounds. The molecules of high-molecular mineral oil compounds (C_{20} and above) according to the investigations of recent years exhibit a mixed (hybrid) structure. With other words, structural members of different homolog series take part in the composition of the molecule. The ratio between structure elements of aliphatic and cyclic nature varies within wide limits according to the chemical nature of the mineral oil. It was decided in this connection to synthesize a number of hitherto not described hydrocarbons with a structure ranging from C_{24} to C_{32} with a different proportion of carbon atoms in the structural elements of the molecule. The produced hydrocarbons together with their properties are given in table 1. It contains 15 compounds. Finally some particulars concerning the synthesis are given. There is 1 table.

TITLE: Selective Catalytic Dehydrogenation of Saturated High-Molecular
Hydrocarbons in Liquid Phase (Izbiratel'naya kataliticheskaya
degidrogenizatsiya predel'nykh vysokomolekulyarnykh uglevodorodov
v zhidkoy faze)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 4,
pp 704 - 706 (USSR)

ABSTRACT: The reaction discovered by Zelinskiy (Ref 1) has not yet
been used for the purpose mentioned in the title, as far as
it can be judged from references. Its usefulness in studying
the structure of high-molecular petroleum hydrocarbons had
to be checked by the authors. Synthetic hydrocarbons C₂₀-C₃₂
were used which contain 1-3 cyclohexane-, 2-Dekalin-, 1-cyclo-
pentane nuclei and 1 paraffin hydrocarbon of normal structure.
First, the optimum conditions of the dehydrogenation mentioned
in the title were determined and the apparatus required was
constructed (Fig 1). Pt on charcoal was used as catalyst

Card 1/3

Molecular Hydrocarbons in Liquid Phase

SOV/20-123-4-36/53

(according to Ref 2). To explain the behaviour of the hydrocarbons of various structure the following individual compounds were synthesized: n-tetracosane, n-octadecyl cyclopentane, 7-cyclohexyl octadecane, 1,5-dicyclohexyl-3-heptyl pentane, 1,5-dicyclohexyl-3-hexahydro benzyl pentane, 1,2-di-(1,3,5-trimethyl cyclohexyl)ethane, 2,11-didecahydro naphthyl dodecane, 1,1-dicyclohexyl dodecane. In the investigation the author found that the dehydrogenation of the individual hydrocarbons, which are the homologs of cyclohexane and Decalin, takes place already at 280°. In the liquid phase the optimum temperature is 315-320°. At that temperature the dehydrogenation of all investigated hydrocarbons which contain isolated as well as condensed hexamethylene structures, is as a whole finished within 5-6 hours, with practically no cracking taking place. Figure 2 shows the change of the hydrogen separation and of its total amount in the course of time. The reaction temperature amounted in all cases to 315°. Table 1 shows the results of the catalytic dehydrogenation of the hydrocarbons and their mixtures. The increase of the number of hexamethylene nuclei and the occurrence of methyl groups in them has only little effect

Card 2/3

Selective Catalytic Dehydrogenation of Saturated High- SOV/20-123-4-36/53
Molecular Hydrocarbons in Liquid Phase

on the dehydrogenation. Two condensed hexamethylene groups render this process more difficult. By interrupting this experiment it was proved that the dehydrogenation of the cyclohexyl nuclei takes place in both directions at the same time: a) Of both nuclei. b) Of only one nucleus. The role of the cyclization by dehydrogenation is unimportant. The above investigation has shown that the method of investigating fractions of the mentioned petroleum hydrocarbons with cycloparaffin nuclei as mentioned in the title may be used successfully for the detailed characterization of their chemical structure. There are 2 figures, 1 table and 2 Soviet references.

[Organic Compounds Contained in Petroleum and Petroleum Products] [Papers of the Third Scientific Session] Moscow, Izd-vo AS SSSR, 1959. 376 p.

Material Board: R.D. Chodanov (Rep.), D.A. Doctor of Chemical Sciences;

G.I. Shestopal, Doctor of Chemical Sciences; Ya. S. Chernikov, Doctor of Technical Sciences;

V.V. Ponomarev, Candidate of Technical Sciences; and V.P. Rostovtsevsky, Tech. Ed.; T.P. Polomova, Tech. Ed.

PURPOSE: This book is intended for chemists, chemical engineers, and technicians specializing in the chemistry of petroleum.

CONTENTS: The book is a collection of papers presented at the Third Scientific Session on the Chemistry of Organic Sulfur and Nitrogen Compounds Contained in Petroleum and Petroleum Products. The scientific session was held in Ure, June 2-5, 1959. The book consists of six sections: 1) Synthesis, characterization, and analysis of organic sulfur compounds; 2) Separation and composition of organic sulfur compounds contained in petroleum and petroleum products; 3) Transformation of organic sulfur compounds by thermal cracking; 4) Corrosive properties of and tar formation in sulfur-containing petroleum and petroleum products; 5) Uses of organic sulfur compounds and byproducts; 6) Physiological properties of organic sulfur compounds. No personnel titles are mentioned. There are 315 references, of which 179 are Soviet,

118 English, 5 French, 12 German, and 1 Czech.

PHASE I BOOK EXPLOITATION

SOV/3336

Sergiyenko, Semen Romanovich

Vysokomolekulyarnyye soyedineniya nefti (High-Molecular Compounds of Petroleum) Moscow, Gostoptekhizdat, 1959. 412 p. 2,600 copies printed.

Exer. Ed.: L. A. L'vova; Tech. Ed.: A. V. Trofimov.

PURPOSE: This monograph is intended for scientific workers and aspirants specializing in chemistry, petroleum technology and petroleum chemical synthesis. It may also be useful to engineers and technicians of the petroleum-refining and petroleum chemical industry.

COVERAGE: An attempt is made to analyze theoretical studies of high-molecular components of petroleum and to summarize experience of the refining industry gained in dealing with resinous or sulfurous crudes and with heavy petroleum products. Composition, properties and structure of high-molecular hydrocarbons from

Card 1/9

High-Molecular Compounds (Cont.)

SOV/3336

petroleum are reviewed along with characteristics of petroleum paraffin and ceresin wax. Chemical properties of high-molecular hydrocarbons of some American and Soviet crudes are analyzed, and the application of adsorption chromatography, infrared spectroscopy, catalytic hydrogenation and dehydrogenation in the study of the chemical structure of high-molecular petroleum components is discussed. Petroleum carboxylic and naphthenic acids, their origin and cause of formation are studied, and petroleum sulfurous organic compounds, resins, asphaltenes and bitumens are analyzed. The author also considers condensed polycyclic hydrocarbons as a possible source of cancer and suggests measures to reduce risk to refiners. Structures of various types of hydrocarbons and the composition of high-molecular hydrocarbons contained in crudes from different regions of the Soviet Union are illustrated in numerous tables. The author thanks V. T. Sklyara, Yu. T. Gordash, I. S. Mayorov, N. V. Zhdanova, B. E. Davydov, Ye. V. Lebedev and M. P. Teterina for their participation in writing certain sections, he also thanks L. V. Ratnikova, S. E. Kreyn and V. A. Sokolov for their help. References, the majority of which are Soviet, appear at the end of chapters.

TITLE: On the Structure of High Molecular Hydrocarbons in Petroleum //

PERIODICAL: Izvestiya Akademii nauk Turkmenской SSR, 1959, No. 4, pp. 10 - 23

TEXT: The article reviews the chemical properties of high molecular hydrocarbons in petroleum as presented in the Section of Chemistry and Technology of Fuel at the 8th Mendeleyev Congress on March 17, 1959 in Moscow. Investigation of chemical and technical properties of these hydrocarbons is important in view of their proposed use as raw materials for synthetic products during the current Seven-Year Plan. Data contained herein have been obtained from 15 different types of Soviet petroleum. The Romashkin, Tuymazin, Baylin, Gyurgyan and other petroleums contain about 40% high molecular hydrocarbons, in heavier petroleum they frequently exceed 50%. To eliminate chemical changes, vacuum was used for distillation of fractions up to 325-350°C, at a maximum temperature of 250°C. Chromatographic fractionation was carried out with coarse-pored activated silica gel (ASK). The group composition of high molecular hydrocarbons and their paraffin-cycloparaffinic (PCP), monocyclicaromatic (MCA) and bicyclicaromatic (BCA) hydrocarbon contents in various types of petroleum is shown in Table 1. The main components of high

Card 1/3

On the Structure of High Molecular Hydrocarbons in Petroleum

1

molecular hydrocarbons are Paraffin-cycloparaffinic hydrocarbons with high hydrogen content (40-60%), bicycloaromatic hydrocarbons with low hydrogen content; and the medium group are definitely monocyclic aromatic hydrocarbons. The differences in chemical properties of petroleum are particularly evident in composition and properties of paraffin-cycloparaffinic hydrocarbons, as far as the determination of their chemical properties remains limited to their reaction in forming a complex compound with carbamide. Distribution of carbon atoms of various chemical properties in similar groups of hydrocarbons extracted from Soviet petroleum is shown in Table 2. The question about chemical properties of cycloparaffinic rings and the relation of hexamethylene and pentamethylene rings in the molecules of paraffin-cycloparaffinic hybridic structures remained unsolved. Number of cyclo-paraffinic and benzene rings in paraffin cycloparaffinic, monocyclic-aromatic and bicyclo-aromatic hydrocarbons extracted from various types of petroleum is shown in Table 3. Groups and properties of paraffin-cycloparaffinic hydrocarbons, monocyclic aromatic petroleum and bicyclic condensed aromatic hydrocarbons are shown in Tables 4, 5 and 6. Results of a three-stage fractionated dehydrogenation are given in Table 7. It shows that the relation of hexamethylene and pentamethylene rings in the Romashkin (Devon) petroleum varies from 1-1.5. Properties and structure of paraffin-cycloparaffinic hydrocarbons extracted from 3 fractions ✓

Card 2/3

S/165/59/000/04/02/026

On the Structure of High Molecular Hydrocarbons in Petroleum

of paraffin cycloparaffinic hydrocarbons are shown in Table 8. Oxidation of benzene homologues in 30 hours at 97-99°C is shown in Table 9 and oxidation of hybridic hydrocarbons C₂₀-C₂₄ in 100 hours at 97-99°C is given in Table 10. The degree of oxidation of benzenecarboxylic acids i.e. oxalic and carbonic acids in 30 hours at 97-99°C is shown in Table 11. The oxidation and infra-red spectroscopy method showed that among high molecular monocyclic hydrocarbons of the Romashkin (Devon) petroleum trisubstituted benzenes are predominant. Tests proved that sulphur contained in high molecular fractions is constitutionally connected with aromatic compounds accompanying bicycloaromatic hydrocarbons. There are 10 tables and 1 diagram.
